

Impact of Severe Weather Events on Public Health and Economy in the United States [Reproducible Research : Project2]

jshiju

Saturday, July 25, 2015

I. OVERVIEW

Synopsis:

In this report, we aim to analyze the impact of different weather events on public health and economy based on the storm database collected from the U.S. National Oceanic and Atmospheric Administration's (NOAA) from 1950 - 2011. We will use the estimates of fatalities, injuries, property and crop damage to decide which types of event are most harmful to the population health and economy. From these data, we found that excessive heat and tornado are most harmful with respect to population health, while flood, drought, and hurricane/typhoon have the greatest economic consequences.

[Basic settings]

```
echo=TRUE
# turn off scientific notations for numbers
options(scipen = 1)
suppressMessages(suppressWarnings(library(R.utils)))
suppressMessages(suppressWarnings(library(ggplot2)))
suppressMessages(suppressWarnings(library(plyr)))
require(gridExtra)
```

```
## Loading required package: gridExtra
```

```
## Warning: package 'gridExtra' was built under R version 3.2.1
```

```
## Loading required package: grid
```

II. DATA PROCESSING

- (a) Data preparation

Download the data from NOAA Storm Database site and unzip it.

```
if (!"stormData.csv.bz2" %in% dir("./data/")) {
  print("hhh")
  download.file("http://d396qusza40orc.cloudfront.net/repdata%2Fdata%2FStormData.csv.bz2", destfile =
  bunzip2("data/stormData.csv.bz2", overwrite=T, remove=F)
}
```

Read the generated csv file. If the data already exists in the working environment, we do not need to load it again. Otherwise, we read the csv file.

```
# use 'cache' as preprocessing is time-consuming

if (!"stormData" %in% ls()) {
  stormData <- read.csv("data/stormData.csv", sep = ",")
}
```

- (b) Basic summary of data

```
dim(stormData)
```

```
## [1] 902297      37
```

```
head(stormData, n = 2)
```

```
##  STATE__      BGN_DATE BGN_TIME TIME_ZONE COUNTY COUNTYNAMES STATE
## 1      1 4/18/1950 0:00:00    0130     CST     97    MOBILE     AL
## 2      1 4/18/1950 0:00:00    0145     CST      3    BALDWIN    AL
##  EVTYPE BGN_RANGE BGN_AZI BGN_LOCATI END_DATE END_TIME COUNTY_END
## 1 TORNADO      0              0
## 2 TORNADO      0              0
##  COUNTYENDN END_RANGE END_AZI END_LOCATI LENGTH WIDTH F MAG FATALITIES
## 1      NA      0              14    100 3    0      0
## 2      NA      0              2    150 2    0      0
##  INJURIES PROPDMG PROPDMGEXP CROPDGM CROPDMGEXP WFO STATEOFFIC ZONENAMES
## 1      15    25.0          K      0
## 2      0     2.5          K      0
##  LATITUDE LONGITUDE LATITUDE_E LONGITUDE_ REMARKS REFNUM
## 1     3040     8812      3051     8806          1
## 2     3042     8755          0          0          2
```

There are 902297 rows and 37 columns in total.

- (c) Exploratory Data Analysis

The events in the database start in the year 1950 and end in November 2011. In the earlier years of the database there are generally fewer events recorded, most likely due to a lack of good records. More recent years should be considered more complete.

```
if (dim(stormData)[2] == 37) {
  stormData$year <- as.numeric(format(as.Date(stormData$BGN_DATE, format = "%m/%d/%Y %H:%M:%S"), "%Y"))
}
hist(stormData$year, breaks = 30)
```

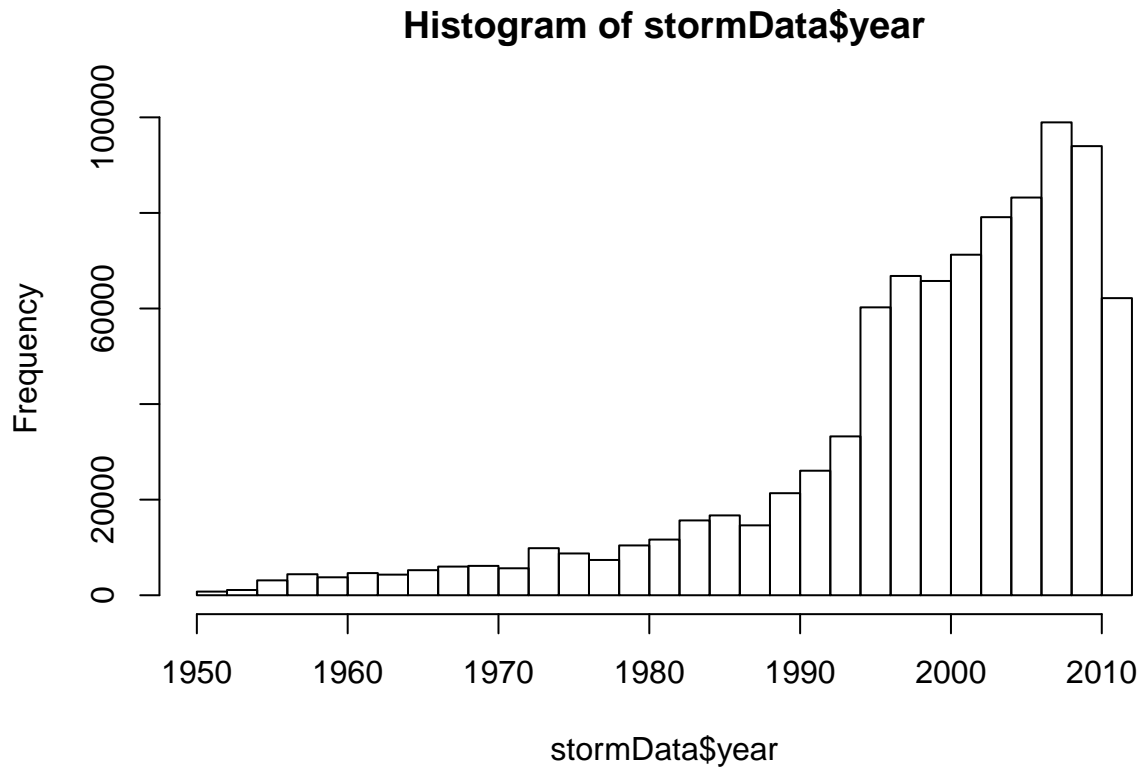

Figure (1) - Storm data year-wise

Based on the above histogram, we see that the number of events tracked starts to significantly increase around 1995. So, we use the subset of the data from 1990 to 2011 to get most out of good records.

```
storm <- stormData[stormData$year >= 1995, ]
dim(storm)
```

```
## [1] 681500    38
```

Now, there are 681500 rows and 38 columns in total.

III. ANALYSIS

- (a) Analysing Impact on Public Health

In this section, we check the number of **fatalities** and **injuries** that are caused by the severe weather events. We would like to get the first 15 most severe types of weather events.

Perform necessary data transformations: Aggregate them by eventtype and sort in the descending order

```
sortHelper <- function(fieldName, top = 15, dataset = stormData) {
  index <- which(colnames(dataset) == fieldName)
  field <- aggregate(dataset[, index], by = list(dataset$EVTYPE), FUN = "sum")
  names(field) <- c("EVTYPE", fieldName)
  field <- arrange(field, field[, 2], decreasing = T)
```

```

    field <- head(field, n = top)
    field <- within(field, EVTYPE <- factor(x = EVTYPE, levels = field$EVTYPE))
    return(field)
}

fatalities <- sortHelper("FATALITIES", dataset = storm)
injuries <- sortHelper("INJURIES", dataset = storm)

```

- (b) Analysing Impact on Economy

Perform necessary data transformations: We will convert the **property damage** and **crop damage** data into comparable numerical forms according to the meaning of units described in the code book ([Storm Events](#)). Both PROPDMGEXP and CROPDMGEXP columns record a multiplier for each observation where we have Hundred (H), Thousand (K), Million (M) and Billion (B).

```

convertHelper <- function(dataset = storm, fieldName, newFieldName) {
  totalLen <- dim(dataset)[2]
  index <- which(colnames(dataset) == fieldName)
  dataset[, index] <- as.character(dataset[, index])
  logic <- !is.na(toupper(dataset[, index]))
  dataset[logic & toupper(dataset[, index]) == "B", index] <- "9"
  dataset[logic & toupper(dataset[, index]) == "M", index] <- "6"
  dataset[logic & toupper(dataset[, index]) == "K", index] <- "3"
  dataset[logic & toupper(dataset[, index]) == "H", index] <- "2"
  dataset[logic & toupper(dataset[, index]) == "", index] <- "0"
  dataset[, index] <- as.numeric(dataset[, index])
  dataset[is.na(dataset[, index]), index] <- 0
  dataset <- cbind(dataset, dataset[, index - 1] * 10^dataset[, index])
  names(dataset)[totalLen + 1] <- newFieldName
  return(dataset)
}

storm <- convertHelper(storm, "PROPDMGEXP", "propertyDamage")

```

```

## Warning in convertHelper(storm, "PROPDMGEXP", "propertyDamage"): NAs
## introduced by coercion

```

```

storm <- convertHelper(storm, "CROPDMGEXP", "cropDamage")

```

```

## Warning in convertHelper(storm, "CROPDMGEXP", "cropDamage"): NAs introduced
## by coercion

```

```

names(storm)

```

```

## [1] "STATE_"      "BGN_DATE"    "BGN_TIME"    "TIME_ZONE"
## [5] "COUNTY"     "COUNTYNAME" "STATE"        "EVTYPE"

```

```
options(scipen=999)
property <- sortHelper("propertyDamage", dataset = storm)
crop <- sortHelper("cropDamage", dataset = storm)
```

IV. RESULTS

As for the impact on public health, we have got two sorted lists of severe weather events below by the number of people badly affected.

fatalities

```
##          EVTYPE FATALITIES
## 1  EXCESSIVE HEAT      1903
## 2      TORNADO      1545
## 3  FLASH FLOOD       934
## 4      HEAT         924
## 5  LIGHTNING        729
## 6      FLOOD        423
## 7  RIP CURRENT      360
## 8  HIGH WIND        241
## 9  TSTM WIND        241
## 10 AVALANCHE        223
## 11 RIP CURRENTS      204
## 12 WINTER STORM      195
## 13  HEAT WAVE        161
## 14 THUNDERSTORM WIND  131
## 15  EXTREME COLD      126
```

injuries

```
##          EVTYPE INJURIES
## 1      TORNADO    21765
## 2      FLOOD     6769
## 3  EXCESSIVE HEAT  6525
## 4  LIGHTNING     4631
## 5  TSTM WIND     3630
## 6      HEAT      2030
## 7  FLASH FLOOD   1734
## 8 THUNDERSTORM WIND 1426
## 9  WINTER STORM  1298
## 10 HURRICANE/TYPHOON 1275
## 11  HIGH WIND    1093
## 12      HAIL      916
## 13  WILDFIRE      911
## 14  HEAVY SNOW    751
## 15      FOG       718
```

And the following is a pair of graphs of total fatalities and total injuries affected by these severe weather events.

```
fatalitiesPlot <- qplot(EVTYPE, data = fatalities, weight = FATALITIES, geom = "bar", binwidth = 1) +
  scale_y_continuous("Number of Fatalities") +
  theme(axis.text.x = element_text(angle = 45,
    hjust = 1)) + xlab("Severe Weather Type") +
  ggtitle("Total Fatalities by Severe Weather\nEvents in the U.S.\nfrom 1995 - 2011")
injuriesPlot <- qplot(EVTYPE, data = injuries, weight = INJURIES, geom = "bar", binwidth = 1) +
  scale_y_continuous("Number of Injuries") +
  theme(axis.text.x = element_text(angle = 45,
    hjust = 1)) + xlab("Severe Weather Type") +
  ggtitle("Total Injuries by Severe Weather\nEvents in the U.S.\nfrom 1995 - 2011")
grid.arrange(fatalitiesPlot, injuriesPlot, ncol = 2)
```

Figure (2) - Fatalities and Injuries based on weather event types

Based on the above histograms, we find that **excessive heat** and **tornado** cause most fatalities; **tornado** causes most injuries in the United States from 1995 to 2011.

As for the impact on economy, we have got two sorted lists below by the amount of money cost by damages.

property

##	EVTYPE	propertyDamage
## 1	FLOOD	144022037057
## 2	HURRICANE/TYPHOON	69305840000
## 3	STORM SURGE	43193536000
## 4	TORNADO	24935939545
## 5	FLASH FLOOD	16047794571

```
## 6          HAIL      15048722103
## 7      HURRICANE      11812819010
## 8  TROPICAL STORM      7653335550
## 9      HIGH WIND      5259785375
## 10         WILDFIRE      4759064000

## 12         TSTM WIND      4482361440
## 13         ICE STORM      3643555810
## 14 THUNDERSTORM WIND      3399282992
## 15     HURRICANE OPAL      3172846000
```

```
crop
```

```
##          EVTYPE  cropDamage
## 1      DROUGHT 13922066000
## 2      FLOOD  5422810400
## 3      HURRICANE 2741410000
## 4          HAIL  2614127070
## 5 HURRICANE/TYPHOON 2607872800
## 6      FLASH FLOOD 1343915000
## 7      EXTREME COLD 1292473000
## 8      FROST/FREEZE 1094086000
## 9      HEAVY RAIN  728399800
## 10     TROPICAL STORM 677836000
## 11         HIGH WIND 633561300
## 12         TSTM WIND 553947350
## 13     EXCESSIVE HEAT 492402000
## 14 THUNDERSTORM WIND 414354000
## 15          HEAT  401411500
```

And the following is a pair of graphs of total property damage and total crop damage affected by these severe weather events.

```
propertyPlot <- qplot(EVTYPE, data = property, weight = propertyDamage, geom = "bar", binwidth = 1) +
  theme(axis.text.x = element_text(angle = 45, hjust = 1)) + scale_y_continuous("Property Damage in US dollars") +
  xlab("Severe Weather Type") + ggtitle("Total Property Damage by\n Severe Weather Events in\n the U.S.")

cropPlot<- qplot(EVTYPE, data = crop, weight = cropDamage, geom = "bar", binwidth = 1) +
  theme(axis.text.x = element_text(angle = 45, hjust = 1)) + scale_y_continuous("Crop Damage in US dollars") +
  xlab("Severe Weather Type") + ggtitle("Total Crop Damage by \nSevere Weather Events in\n the U.S. for 2004-2012")
grid.arrange(propertyPlot, cropPlot, ncol = 2)
```

Figure (3) - Property and crop damage by weather event types

Based on the above histograms, we find that **flood** and **hurricane/typhoon** cause most property damage; **drought** and **flood** causes most crop damage in the United States from 1995 to 2011.

V. SUMMARY

Based on the analysis performed above, we can arrive at the following conclusions:

1. The weather event types **excessive heat** and **tornado** are most harmful with respect to population health and
2. Event types **flood**, **drought**, and **hurricane/typhoon** have the greatest economic consequences.
